ITALIAN ARCHITECTURE & DESIGN

HILON INTERNATIONAL

Hilon International

Project Management Group

Hilon International performs the design and supervision of operations related to constructions of interior design projects.

The procedure is based on the fusion of the various specializations that are concentrated in a single knowhow, knowledge and investigations at the complete disposal of the investor.

The result is a broad competence in the operating area that leads to the construction of building complexes.

Hilon International Group is active in Italy, Spain, United Arab Emirates, Pakistan, U.S.A., Switzerland, Ukraine, Croatia, Serbia, Montenegro, Bosnia and Herzegovina.

Skyline Parking® - More parking in less space.

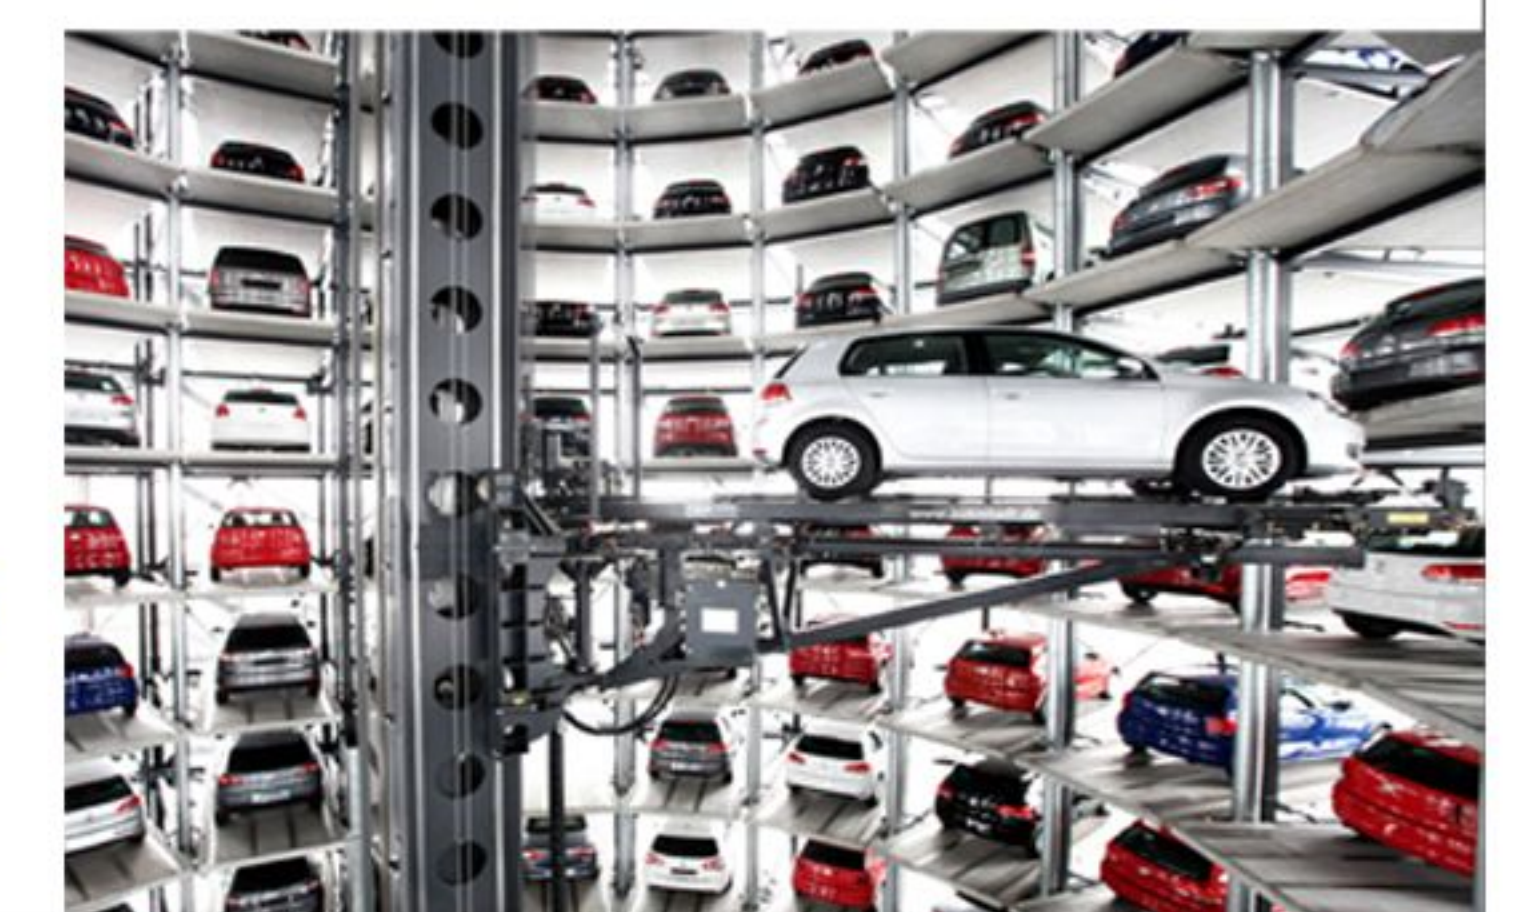

In a parking garage sometimes 10 tons of steel and concrete are used per parking place. This represents a ratio of 1:5 comparing the weight of a car to the weight of the building material. In APS in average 2 tons of steel and concrete is needed per car. In addition, an APS usually does not need much lighting, no emergency exits, ventilation, stairs or passenger lifts. Perfection is not when you cannot add anything anymore, but when you cannot omit anything anymore. This is the principle we follow in the development of our APS.

A conventional car park needs a plot of at least 35 x 35 meters, thus around 1000 square meters. Smaller plots of land or gaps between buildings cannot be utilised. Car parks therefore have to be built on valuable large plots of land that otherwise could be used for residential and commercial developments. An APS can be erected on almost any area which measures at least 20 square meters or more. They can be built as slender towers onto existing buildings or as attractively integrated structures complementing a modern urban environment.

The most important requirement for an automated parking system is its performance or throughput; in other words the maximum number of cars that can enter or leave the APS within one hour. It is therefore important to know the highest daily expected traffic peaks in the busiest 15 Minutes of the day. Conventional parking garages can handle a throughput of around 200 cars per gate. Skyline Automatic Parking Systems handle approx. 60 to 100 cars per conveyor belt. In larger installations with 10 to 20 conveyors the same results as in a similar conventional parking garage can be achieved hence a throughput of 1000 or more cars per hour. Automated Parking Systems are therefore well suited for high capacity installations, and specifically also for airports where the average parking time is high, the traffic flow is distributed over long periods of time and the peak is rather low in relation to the capacity.
